This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein prod. of ORF-1 from the hepatitis E virus (HEV) strain SAR-55, which was implicated in an enterically transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by the structural region of the virus (i.e. ORF-2), which is capable of forming HEV like particles, is useful for the detection of HEV antibodies (pref. IgG or IgM) in blood, plasma, sera, cerebrospinal fluid, tissue, urine or pleural fluid. The
            protein, and anti-HEV antibodies generated using the protein, can also be used in vaccines for immunising an animal against HEV infection. The protein is identified as a band of greater than 50 kD following SDS-PAGE of cell lysates of insect cells infected with a HEV ORF-2 contg. Daculovirus, i.e. the claimed recombinant expression vectors pPIC9-1779, -1780 and -1781.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21-077-1994 (first entry)
HEV strain protein encoded by ORF-1.
Hepatitis E virus; HEV; strain SAR-55; open reading frame; ORF; antibody; detection; diagnosis; primates; stool suspension.

New hepatitis is virus DNA from Pakistani strain SAR-55 - used for, hepatitis E virus DNA from dagnosis of, and vaccination against hepatitis E virus infection
Disclosure; Pages 11-15; 204pp; English.

This represents a hepatitis E virus (HEV) open reading frame (ORF)-1 protein encoded by a DNA sequence designated SAR-55. SAR-55 also encodes HEV ORF-2 and ORF-3 proteins. A host organism transformed or transfected with a recombinant expression vector containing the SAR-55 uncleic acid with a recombinant expression vector containing the SAR-55 nucleic acid recombinant HEV proteins can be used to produce the HEV proteins, especially ORF-2 protein. The recombinant HEV proteins can be used as diagnostic agents and as vaccines for use against HEV infection. The detection of antibodies specific for use against HEV infection. The detection of antibodies specific for use against HEV ladagnosis of infection and diseases caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ω

The sequences given in R51264-66 are encoded by the hepatitis E virus frames (ORFS). These proteins can be used to stimulate the production of protective antibodies upon injection into a mammal that would serve to protect the mammal upon challenge with wild type HEV. The proteins can be used for detection and diagnosis of HEV. The proteins can be used for detection and diagnosis of HEV infection. The HEV sak-55 cDNA was isolated from primates innoculated with stool suspensions obtained from hepatitis E patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                572 frtsfvdgavletngperhnlsfdasgstmaagpfsltyaasaaglevryvaagldhrav 631

Claim 22: Columns 57-66; 47pp; English.

Wall96-98 are encoded by the genome of the Burma strain of enterically transmitted non A non B hepatitis virus (ET-NANB) (hepatitis E virus (HEV)). The specification describes an isolated protein which is specifically immunoreactive with antibodies present in individuals infected with HEV and encoded by a sequence contained in an open reading frame (ORF) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORFI sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for ET-NANB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        572 frtsfydgayletngperhnlsfdasqstmaagpfsltyaasaaglevryvaagldhrav 631

New insecticidal Bacillus thuringlensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis.

PT Glaim 14; Pages 32-34; Sopp. English.

Tellothis virescens and Helicoverpa zea

Tellothis virescens and Helicoverpa zea

Tellothis virescens and Helicoverpa zea

This is the amino acid sequence of a novel Bacillus thuringlensis toxin used in the method of the invention, to control lepidopteran pests.

The new toxins are useful as pesticides, especially for the control of ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The colynuclectide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of for novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       э;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A positive clone ET1.1 was identified in a library prepared from blie of cynomolgus monkeys infected with the Burma strain of ET-NANB. Both strands of ET1.1 were sequenced. Identity of the sequence with sequences in etiologic agents has been confirmed by locating a similar sequence in a viral strain isolated in Burma. This protein is encoded by the longest ORF (ORF 1) of the Burma strain.

Example 5; Fig 12; 149pp; English.

Example 5; Fig 22; 149pp; English.

This sequence is encoded by the Arabidopsis thaliana ethylene response (ETR) gene, designated OITR. The ETR gene is used in the antisense expression construct of the invention, which also contains a promoter. Expression of the construct in a plant cell results in a decreased response to ethylene by the cell. The constructs are useful for the production of plants which have a decrease in physiological responses to the presence of ethylene. Ethylene is a plant hormone which is involved in various positive plant controls e.g. growth, development and fruit ripening, and is also induced by environmental stresses wounding, pathogenic infection and flooding. Controllable, inducible expression of ethylene antisense constructs in transformed plant cells allows and vegetables.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A thaliana ethylene response protein QITR.

We Ethylene response gene: ETR: plant hormone; plant growth modulation; plant development control: fruit ripening.

Arabidopsis thaliana.

Mean 21.936; Variance 22.856; scale 0.960 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MAY BE INVOLVED IN REPLICATION.
FUNCTION: NUCLEAR INCLUSION PROTEIN A HAS PROTEOLYTIC ACTIVITY.
PTM: UPG IS COVALENTLY LINKED TO THE GENOMIC RNA.
PTM: THE VIRAL RNA OF POTYVIRUSES IS EXPRESSED AS A SINGLE
POLYPROTEIN WHICH UNDERGOES POSTTRANSLATIONAL PROTEOLYTIC
PROCESSING RESULTING IN THE PRODUCTION OF AT LEAST EIGHT
INDIVIDUAL PROTEINS.
                                                                                                                                                              NON MOSAIC VIRUS (STRAIN NL-3 / MICHIGAN) (BCMV).
SSRNA POSITIVE-STRAND VIRUSES, NO DNA STAGE; POTYVIRIDAE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: HC PROTEINASE BELONGS TO PEPTIDASE FAMILY C6. SIMILARITY: NI-A PROTEINASE BELONGS TO PEPTIDASE FAMILY C4. SIMILARITY: BELONGS TO THE POTYVIRUSES POLYPROTEIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 6 KD PROTEIN 1. AROE B.A., LIPINSKI M.;
AROE B.A., LIPINSKI M.;
TEMRI, an unusual member in the family of hormone receptors with
Seven transmembrane segments.";
GENOMICS 26:334-344(1955).

- FUNCTION: PROBBLY INVOLVED IN CELLULAR RESPONSE TO A HORMONE OR
AN INTERACTION WITH A PROTEIN LIGAND.
- FUNCTION: PROBBLY INVOLVED IN LIGAND.
- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
- ISSUE SPECIFICITY: WIDE EXPRESSION: INCREASED LEVELS IN
PERIPHERAL BLOOD MONOUNCLEAR CELLS.
- PRIN: N- AND O-GLYCOSYLATED; (POSSIBLE).
- SIMILARITY: CONTAINS 6 EGF-LIKE DOMAINS.
- SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS.
EWR1_HUMAN STANDARD: PRT; 886 AA.

SENSITION CALCIUM CHANNEL OF THE DIHYDROPYRIDINE (DHP)
SENSITIVE CALCIUM CHANNEL (BY SIMILARITY).
--- SUBUNIT THE L-TYPE CALCIUM CHANNEL IS COMPOSED OF FOUR SUBUNITS
ALPHA-1, ALPHA-2, BETA AND GAMA.
--- TISSUE SPECIFICITY: EXPRESSED IN ALL TISSUES.
--- ALTERNATIVE PRODUCTS: THREE FORMS ARE PRODUCED BY ALTERNATIVE
SPLICING OF THE GENE.
--- SIMILARITY: CONTAINS 1 SH3 DOMAIN.
--- SIMILARITY: TO OTHER CALCIUM CHANNEL BETA SUBUNITS.
                                                                                                                                                                                                                                                                                                   "Cloning and characterization of a Lambert-Eaton myasthenic syndrome antigen."; ANN. NEUROL. 33:113-120(1993).

RT CONTRACTION: THE SRELETAL MUSCLE DHP-SENSITIVE CA(2+)

CC CONTRACTION COUPLING. THE SKELETAL MUSCLE L-TYPE CALCIUM CHANNEL IS COMPOSED OF

FIVE SUBUNIT: ALPHA-1, ALPHA-2, BETA, GAMMA AND DELTA.

CC SUBUNIT ARE PRODUCES THREE, TISSUE-SPECIFIC, FORMS OF THE GENE.

CC -1 TISSUE SPECIFICITY: SKELETAL MUSCLE.

CC -1 ALTERNATIVE PRODUCTS: THREE, TISSUE-SPECIFIC, FORMS OF THE GENE.

CC -1 SIMILARITY: TO OTHER CALCIUM CHANNEL BETA SUBUNITS.

CC -1 SIMILARITY: TO OTHER CALCIUM CHANNEL BETA SUBUNITS.

useful for recombinant production of the channel for screening of useful for recombinant production of the channel for screening of its modulators, and diagnosis of Lambert Eaton Syndrome Claim 3: Columns 219-224: 166pp. English.

The present scquence represents a splice variant of the beta subunit of a human calcium channel. Calcium channels are membrane-spanning, multi-subunit proteins that allow controlled entry of calcium ions into cells. This leads to depolarisation events required for muscle contraction. The recombinant subunit, when expressed with nucleic acids encoding the complete calcium channel, can be used in assays for the detection and characterisation of compounds that modulate the channel. The Na encoding the subunits can be alternatively spliced when transcribed, giving more than one form of the protein from the same transcribed, giving more than one form of the protein from the same transcribt, each having slightly different properties. In addition, the cranscribt of the alpha I subunit with IgG molecules from the serum of an individual with Lambert Eaton Syndrome (LES) can be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Disclosure: Page 163-165; 288pp; English.

To isolate DNA encoding the Beta I subunit, a human hippocampus cDNA library was screened by hybridisation to a DNA fragment encoding a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate encoding in the overlapping clones until the overlapping clones until the overlapping clone such and sequenced. Five alternatively spliced forms of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

             beta 1.1, expressed in skeletal muscle, beta 1.2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-4, expressed in aorta tissue and HEX 293 cells, and beta 1-5, expressed in HEX 293 cells. Full-length DNA clones encoding the beta 1-2 and beta 1-3 subunits have been constructed. The subunits beta 1-1, beta 1-2, beta 1-4 and beta 1-5 have been identified by nucleic acid amplification; analysis as alternatively spliced forms of the beta subunit. Sequences of the beta 1 splice variants are set forth in Q87838/R72611, Q87839/R72612 and QQ87831-Q87833 and
beta 1 subunit have been identified. These forms are designated

The present sequence represents the beta subunit of a human calcium channel: Calcium channels are membrane-spanning, multi-subunit channel. Calcium channels are membrane-spanning, multi-subunit channel. Calcium channels are membrane-spanning, multi-subunit in proteins that allow controlled entry of calcium into cells.

This leads to depolarisation events required for muscle contraction. The recombiant subunit, when expressed with nucleic acids encoding the complete calcium channel, can be used in assays for the detection and characterisation of compounds that modulate the channel. The DNA encoding the subunits can be alternatively spliced when transcribed, glving more than one form of the protein from the same transcribed, glving more than one form of the protein from the sectivity of the alpha 1 subunit with IgG molecules from the serum of an individual with Lambert Eaton Syndrome (LES) can be used as a squence 530 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for agonists and antagonists of calcium channels of calcium 2; page 11-13; 13pp; German.

A first oligonucleotide probe (046075) complementary to nucleotides 361-400 of the VDCC beta-subunit from rabbit skeletal muscle was used to screen a human hippocampus cDNA library. A 1.9kb cDNA fragment was isolated for further screening to isolate human vDcC neta-subunit coding sequences. Clone HBB3 was sequenced and nucleotides 1-1288 were found to have 92% homology to the rabbit beta-subunit; from position 1289 there is no detectable homology. The anino acid sequence R39565 was deduced from the open reading frame. See also Q46076 and Q46077.

To isolate DNA encoding the Betel subunit, a human hippocampus

To isolate DNA encoding the Betel subunit, a human hippocampus

To isolate DNA encoding the Betel subunit, a human hippocampus

CDNA library was screened by hybridisation to a DNA fragment

encoding a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate

overlapping clones until the overlapping clones encompassing DNA

encoding the entire human calcium channel beta 2 subunit were

solated and sequenced. Five alternatively spliced forms of the

beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the

CNS, beta 1-3, also expressed in the CNS, beta 1-4, expressed in

corta tissue and HEX 293 cells, and beta 1-3, expressed in HEX 293

cells. Full-length DNA clones encoding the beta 1-2 and beta 1-3,

subunits have been constructed. The subunits beta 1-2,

beta 1-4 and beta 1-5 have been identified by nucleic acid

amplification analysis as alternatively splice variants are set

forth in Q87838/R72611, Q87833/R72612 and QQ87831-Q87833 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding specific human calcium channel sub-units - used for identifying calcium channel agonists and antagonists and diagnosing Lambert Eaton syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human calcium channel subunit; diagnosis; agonist; antagonist;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA encoding human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for obtaining agonists and antagonists.

To developing prods. for studying calcium channels, e.g. for obtaining agonists and antagonists.

To isolate DNA encoding the Beta I subunit, a human hippocampus companies are abbit skeletal muscle calcium channel beta subunit.

To isolate DNA encoding the Beta I subunit, a human hippocampus concoding a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate concoding the entire human calcium channel beta 2 subunit were concoding the entire human calcium channel beta 2 subunit were solated and sequenced. Five alternatively spliced forms of the isolated and sequenced. Five alternatively spliced forms of the beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the beta 1-5, expressed in HEK 293 cells, and beta 1-6, expressed in HEK 293 cells, and beta 1-7, expressed in HEK 293 cells. Full-length DNA clones encoding the beta 1-2 and beta 1-2, expressed in the cells. Full-length DNA clones encoding the beta 1-1, beta 1-2, expressed in militation analysis as alternatively spliced forms of the beta subunit. Sequences of the beta 1 splice variants are set forth in QNY88/RY2611, QNY831-QNY831-QNY833 and
Five alternatively spliced forms of the human calcium channel beta I subunit have been identified and DNA encoding a number of forms have been isolated. These forms are designated beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta and HEK 293 cells, and beta 1-5, expressed in HEK 293 cells.
                                                                                                                                                                                                                        Gaps

be alternatively spliced when transcribed, giving more than one form of the protein from the same transcript, each having slightly different properties. In addition, the reactivity of the alpha I subunit with IgG molecules from the serum of an individual with Lambert Eaton Syndrome (LES) can be used as a diagnostic for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New purified myasthenic antigenic polypeptide and its corresp. antibody - useful for diagnosing and treating proliferation of neoplastic cells in patient with Lambert-Eaton myasthenic syndrome Claim 5; Page 26-77; 48pp; English.

The sequence is that of myasthenic antigenic polypeptide (MAP) encoded by the cDNA clone p mysB. MAP can be used to detect antibodies associated with parameoplastic sensory neuronopathy such as Lambert-Eaton myasthenic syndrome (LEMS). These antibodies are used to determine if a patient with neurological symptoms has a tumour expressing MAP, to inhibit proliferation of neoplastic cells in LEMS.

Without vaccing human calcium channel alpha 1B sub:unit protein - useful for recombinant production of the channel for screening of useful for recombinant production of the channel for screening of its modifiators, and diagnosis of Lambert Eaton Syndrome Claim 3: Columns 217-220; 166pp; English.

The present sequence is encoded by a splice variant of the beta subunit of a human calcium channel. Calcium channels are membrane-spanning, an uniti-subunit proteins that allow controlled entry of calcium ions into calls. This leads to depolarisation events required for muscle contraction. The recombinant subunit, when expressed with nucleic acids encoding the complete calcium channel, can be used in assays for the detection and characterisation of compounds that modulate the channel. The DNA encoding the subunits can be alternatively spliced when transcribed, giving more than one form of the protein from the same transcribed, giving more than one form of the protein from the same transcribed, giving more than one form of the protein from the same transcribed, giving more than one form of the protein from the same transcribed, giving more than one form of the protein from the same creativity of the alpha 1 subunit with IgG molecules from the serum of a midividual with Lambert Eaton Syndrome (LES) can be used as a minimal contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
               Claim 2; Page 5-7; 13pp; German.
A first oligonucleootide probe (Q46075) complementary to nucleotides A first oligonucleootide probe (Q46075) complementary to nucleotides 151-400 of the VDCC beta-subunit from rabbit skeleta! muscle was used to screen a human hippocampus cDNA library. A 1.9kb cDNA fragment was isolated for further screening to isolate human VDCC beta-subunit coding sequences. Clone HBBI was sequenced and found to have 92% homology to the rabbit beta-subunit. The amino acid sequence R39563 was deduced from the open reading frame.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for developing prods. for studying calcium channels, e.g. for obtaining agonists and antagonists.

To isolate DNA encoding the Beta I subunit, a human hippocampus to isolate DNA encoding the Beta I subunit, a human hippocampus conversing a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate encoding the entire human calcium channel beta subunit.

A hybridising clones until the overlapping clones encompassing DNA encoding the entire human calcium channel beta 2 subunit were isolated and sequenced. Five alternatively spliced forms of the beta 1 subunit have been identified. These forms are designated beta 1 subunit have been identified. These forms are designated conta tissue and HEK 293 cells, and beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-1, expressed in the corta tissue and HEK 293 cells, and beta 1-5, expressed in the corta tissue and hex 293 cells, and beta 1-5, expressed in the corta tissue and beta 1-5 have been identified by nucleic acid maplification analysis as alternatively spliced forms of the beta subunit. Sequences of the beta 1 splice variants are set forth in Q87838/R72611, Q87833-Q88881-Q8888-R72611, Q87833-Q88883-R72612 and QQ88831-Q88883-R72612.

Useful for recombinant calcium channel alpha IB sub:unit protein -
useful for recombinant production of the channel for screening of
its modulators, and diagnosis of Lambert Eaton Syndrome
Disclosure; Columns 227-230; 166pp; Eaton Syndrome
Disclosure; Columns 227-230; 166pp; Eaton Syndrome
The present sequence represents the beta-5 subunit of a human calcium
channel. Calcium channels are membrane-spanning, multi-subunit proteins
that allow controlled entry of calcium ions into cells. This leads
to depolarisation events required for muscle contraction. The recombinant
subunit, when expressed with nucleic acids encoding the comprise calcium
channel, can be used in assays for the detection and characterisation of
compounds that modulate the channel: The DNA encoding the subunits can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

To isolate DNA encoding the Beta I subunit, a human hippocampus.

Con Albrary was screened by hybridisation to a DNA fragment encoding a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate overlapping clones until the overlapping clones encompassing DNA encoding the entire human calcium channel beta 2 subunit were sconding the entire human calcium channel beta 2 subunit were solated and sequenced. Five alternatively spliced forms of the tasolated and sequenced in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-4, expressed in the CNS, beta 1-7, expressed in the CNS, beta 1-1, and have been constructed. The subunits beta 1-1 and beta 1-5 have been identified by nucleic acid amplification analysis as alternatively spliced forms of the beta 1-2, chan beta 1-2, chan beta 1-2, chan beta 1-2, chan beta 1-3, ch

The Public National National Part of the channel of the channel for screening of useful for recombinant production of the channel for screening of the useful for recombinant production of the channel for screening of the meditators, and diagnosis of Lambert Eaton Syndrome Disclosure; Columna 225-228; 166pp; English.

The present sequence represents the beta-4 subunit of a human calcium channels are membrane-spanning, multi-subunit proteins that allow controlled entry of calcium ions into cells. This leads to depolarisation events required for muscle contraction. The recombinant subunit, when expressed with nucleic acids encoding the complete calcium channel, can be used in assays for the detection and characterisation of compounds that modulate the channel. The DNA encoding the subunits can be alternatively spliced when transcribed, giving more than one form of the protein from the same transcribt, each having slightly different properties. In addition, the reactivity of the alpha I subunit with IgG molecules from the serum of an individual with Lambert Eaton Syndrome (LES) can be used as a diagnostic for the disease.
